

# Humic Acid

## GUARANTEED ANALYSIS

Humic Acid .....	94%
Potash (K <sub>2</sub> O) .....	8%

Water soluble **Humic Acid** is a potassium salt of the humic acid, it also known as potassium humate. It has all the characteristics of the humic acid and it is also very similar to fulvic acid and it actually has 15% of it in its content. However, it has not the disadvantages of the traditional humic acid, like insolubility, precipitation and/or solid separation after dilution is made.

In total including the humic and the fulvic acids, it has a total of 70% of humic matter at a minimum and remains in the solution as long as necessary. The shelf life is indefinite with no fermentation or occurrence of precipitation.

### General Application:

Seed soaking: Dilute in 0.01-0.03 % with water, adjust pH to 7.2-7.5. Apply only once before seeding.

Irrigating: Make the product to dilute in water and then apply to the soil with an irrigation system. Concentration should be about 0.01 to 0.05 %. Recommended dosage is 8-12 kg/ha. Apply only once after seeding.

Dosage: 11-22 kg/ha  
Grains: 22-56 gm/ha  
Horticulture: 22-56 gm/ha

Net content 20 kg
